

Got Maggots? Think screw-worm fly

To report an animal with a maggot-infested wound

- 1 Take a photo of the wound and maggots.
- 2 Contact your veterinarian, state/territory agriculture department or call the Emergency Animal Disease Hotline.
- 3 Follow expert advice. This may include collecting and submitting sample maggots to the laboratory for identification. Free, ready-made maggot collection kits are available from your state/territory agriculture department.

To collect maggots for identification

- 1 Confine the animal for sampling.
- 2 Gently flush the wound with cool, clean, running water to wash off secondary strike maggots.
- 3 Using tweezers, collect up to 10 maggots that remain deep in the wound and place in a container.
- 4 Pour hot water (just off the boil) over the maggots in the container and wait for 2 minutes for the maggots to die.
- 5 Transfer maggots to a small, watertight container and immerse the maggots in alcohol-based hand sanitiser or 80% ethanol.
- 6 Seal the container and place it in a zip-lock bag with some absorbent paper.
- 7 Phone your state/territory agriculture department to get advice about sending maggots to your government laboratory. If posting, pack in a small padded bag or box and leave the Aviation Security and Dangerous Goods Declaration unsigned to send by surface mail. Lodge over the counter at any Post Office.
